ABSTRACT: The authors prepared homogeneous ion exchange membranes by combining polystyrenesulfonic acid (sulfurated to 94% of theoretical capacity) with a calculated amount of polyvinyl alcohol, drying thin layers of the poured solution at room temperature and heating the films at 120C for two hours in a thermostat. The coefficient of swelling and electrical resistivity of the films were found to decrease with an increase in the proportion

TITLE: Synthesis and investigation of ionite membranes based on polystyrene sulfonic acid and polyvinylalcohol

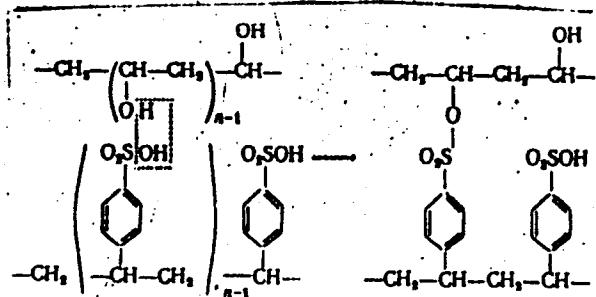

SOURCE: Plasticheskiye massy*, no. 6, 1964, 10-12

TOPIC TAGS: ionite, ionite membrane, synthesis, polystyrenesulfonic acid polyvinylalcohol mixture, polystyrene sulfonation, water resistance, IR spectra, water desalting

ABSTRACT: The possibility of obtaining ionite membranes (suitable for instance for electrochemical desalting of water) by combining up to 60 mol% of water soluble polystyrenesulfonic acid (PSSA) with polyvinylalcohol (PVA) was established. Polystyrene was sulfonated with SO_3 in dichlorethane solution; a relatively low molecular weight polystyrene was used since the degree of sulfonation increases with decrease in molecular weight. A homogeneous solution of the PSSA and PVA was prepared and cast to form a film which was dried at 120°C for 2 hours. The water resistance of the product membrane is explained by the formation of a chemical

ACCESSION NR: AP4039941

bond between the SO_3H group of the polyelectrolyte and the OH of the PVA:

The IR spectra of PVA, PSSA and of the product are shown. The 1650 cm^{-1} band (free OH group) seen in the spectra of PVA and PSSA is absent in the membrane spectrum. This is explained by the possible hydrogen bond formation between the SO_3H and OH groups or ether bonds between the PVA hydroxyl groups. The low intensity of the 1740 cm^{-1} band in the PVA spectrum indicated the absence of acetyl groups. Orig. art. has: 3 figures, 1 formula and 3 tables.

TITLE: Study of the seismicity of the Arctic

CITED SOURCE: Sb. Seysmol. issledovaniya. No. 5. M., AN SSSR, 1963, 7-26

TOPIC TAGS: Arctic earthquake, Arctic seismicity

TRANSLATION: A detailed historical literature survey on instrumental studies of Arctic earthquakes. First, in 1911, B. B. Golitsyn determined the position of the epicenter of the strong Icelandic earthquake of January 22, 1910 (68° N. Lat., 17° W. L.) from the seismograms of the Pulkovo station. I. I. Vilip used the same method to determine the coordinates of the Icelandic earthquake of May 6, 1912 ($60^{\circ} 04'$ N. Lat., $20^{\circ} 06'$ W. L.). Further investigations revealed a seismoactive belt stretching from the Atlantic through Iceland, Jan Mayen, and Spitzbergen to the islands of Franz Josef Land and Severnaya Zemlya. As a result of an investigation of the earthquake of November 20,

ACCESSION NR: AR4020761

1933 in the Baffin Bay, N. V. Rayko and N. A. Linden extended this belt to the northern shores of Asia. The Alyaskinsk earthquake of July 22, 1937 ($64^{\circ}35'$ N. Lat., $145^{\circ}50'$ W. L.) and a series of other jolts at this location were thoroughly investigated. The study was carried out in the epicentral zone by examining and collecting macroseismic information and made use of seismograms of a large number of stations. Significant progress was made in the investigation of the seismicity of the Arctic during the IGY. Thus, the seismic zones of Fennoskandiya, the Kola Peninsula, and the northeast of the USSR were established. The characteristics of the distribution of epicenters were found to be closely related to the tectonics of these regions. Principal seismic data on 62 Arctic earthquakes are given for the period 1957-1959, as well as a list of weak local earthquakes recorded during that period by Soviet Arctic seismic stations.

ugol'shchikov po okhrane nedr Kuzbassa, 1954 g.
Kemerovo, Knigoizdat, 1955, pp 5-16

ABSTRACT: The author gives data on the coal losses in the Kuzbas
mines. He reveals inadequacies in the methods of
mining the deposits of the basin and shows the effect
of the coal loss on mine production, net cost of the
coal, and length of production of the mine. Every ton
of coal uncovered by major mining operations but not
extracted from the mines means a loss of 2.5 to 3.0

SOV/68-59-1-16/26

AUTHOR: Dvorin, S.S.

TITLE: Conference on the Widening of Resources of Coking Coals
in the Kuznetskiy Basin (Soveshchaniye po rasshireniyu
syr'yevoy ugcl'noy bazy koksovaniya v Kuznetskom basseyne)

PERIODICAL: Koks i Khimiya, 1959, Nr 1, pp 56 - 60 (USSR)

ABSTRACT: The conference took place in the town of Kemerovo, on
June 12 - 13, 1958 and was organised by the metallurgical
and coking sections of the Technical-economic Council
of the Kemerovo Sovnarkhoz and by the coal group of the
GNTK Scveta Ministrov RSFSR (State Scientific-technical
Committee of the Council of Ministers of the RSFSR). Chief
engineer of the "Kuzbassugol", N. I. Lindenau, reported on
the perspective of winning coking coals from the Kuznetskiy
Basin during 1959-1965. The total deliveries of coking
coals from the Kuznetskiy Basin should increase from 25.1
million tons in 1958 to 42 million tons in 1965. In order
to obtain the above output in 1959-1965, the following
measures are planned: sinking of 26 new shafts of an
output capacity of 37.6 million tons; starting operation
in 22 new shafts of a capacity of 34.1 million tons,
reconstruction of 21 shafts of a capacity of 25.9 million
tons, construction of 18 coal washeries of a capacity of

Card1/8

SOV/68-59-1-16/26

Conference on the Widening of Resources of Coking Coals in the
Kuznetskiy Basin

50 million tons/year, starting operation during 1959-1965 in 12 coal washeries of a capacity of 33.6 million tons/year. He also gave qualitative characteristics of coking coals from regions under development.

S.A. Sazanov (Gosplan) (RSFSR) read a paper "The Development of the Iron and Steel Industry in the East and Requirements of the Iron and Steel Works for Coking Coals during the Next 7 Years", in which he pointed out the possibility of utilising weakly caking coals which can solve all the difficulties in securing requirements of the industry. He considers that of all the new methods of coal preparation which can be effectively utilised in the near future, the preferential crushing in conjunction with stamp charging is the only one. He considers that by this method about 9 million tons of coke can be produced.

I.V. Gebler communicated on the work carried out in the Tomskiy politekhnicheskiy institut (Tomsk Polytechnical Institute) on coking of blends with a high content of Kuznetskiygas coals with additions of finely crushed coke breeze. It was established that an addition of 5% of coke increases bulk density of blends on average by 5%. With a

Card2/8

SOV/68-59-1-16/26

Conference on the Widening of Resources of Coking Coals in the
Kuznetskiy Basin

5% of coke additions up to 60% of gas coals can be incorporated without any decrease in the coke quality.² Coke should be crushed to pass screens with 500 mesh/cm². In addition heat requirements for coking are decreased. M.Uy. Grigor'yev (Kemerovo Mining Institute) communicated on possible methods of increasing coking coal resources from the Kuznetskiy Basin. Namely, shortage of coals Zh and K can be replaced by coals G, K₂, OS and SS without decreasing coke quality by application of some new methods of preparation of blends which are at present under investigation. The most promising method is that of IGI AN SSSR. Other methods are: petrographic beneficiation by preferential crushing and further beneficiation to a sp.g 1.35-1.40; blending of thermally treated coals 30-35% addition of thermally treated gas coals can replace 15-20% of K and Zh coals. G.N. Makarov (Moskovskiy khimiko-tehnologicheskiy institut im. D.I. Mendeleyeva - Moscow Institute of Chemical Technology imeni D.I. Mendeleyev) in a paper "The Enlargement of Resources of Coking Coals by Using in Blends Preliminary Heat-treated Gas Coals" reported on trials of charging

Card3/8

SOV/68-59-1-16/26

Conference on the Widening of Resources of Coking Coals in the
Kuznetskiy Basin

pre-heated blends into ovens (Koks i Khimiya, 1957, Nr 4). N.I. Gryaznov (VUKhIN) in a paper "An Increase in the Utilisation of Gas Coals by Their Rational Preparation" reported on the work of the institute on preferential crushing (Koks i Khimiya, 1956, Nr 8, 1957, Nr 4 and 1958, Nrs 2 and 3). He pointed out that on preferential crushing, a large amount of non-caking grains is too finely crushed which sharply decreases their caking ability. Combination of preferential crushing with stamp charging is very promising as the influence of negative factors of each method is compensated.

VUKhIN developed a method of utilising coarsely ground gas coals in coal blends. If a finely crushed coal blend by itself has sufficient caking ability, then coarsely ground gas coals can be added without decreasing the quality of coke. Additions of coarse grained gas coal decrease the proportion of dust in the blend and increase its bulk density. An increase in the bulk density can be also obtained by drying of coal.

I.I. Amosov (IGI AN SSSR) reported on "Blending of Coals For Coking According to Their Petrographic Composition"

Card4/8

SOV/68-59-1-16/26
Conference on the Widening of Resources of Coking Coals in the
Kuznetskiy Basin

(Koks i Khimiya, 1957, Nr 12).

I.I. Yurenkov (VNIIUgleobcgashcheniye) in a paper "Enlargement of the Resources of Coals for Coking by the Utilisation of Gas and Weakly Caking Coals in Blends" considered that the most efficient method of utilising such coals is preferential crushing. The other methods considered are: the production of ferro-coke (briquettes) and additions of coal-tar pitch, briquetting and subsequent coking.

A.P. Dubrovin (Tsentrogiproshakht) in a paper "Perspective of Coal Beneficiation in the Kuznetskiy Basin for the Next 7 Years" reported that the development of coal beneficiation lags behind coal winning. Ash content of coals sent for coking increased by 0.5% in comparison with 1953, and the ash content of coal sent to washeries increased from 11% in 1953 to 31.1% in 1957; correspondingly, the yield of concentrates decreased from 91.1% to 83%. In view of increasing ash content in coals, the yield of concentrates in 1965 will decrease to 78%. A brief outline of planned construction of coal washeries is given (15 new washeries of total output of 3.4 million t/year; in 1966, 43 washeries

Card 5/8

SOV/68-59-1-16/26

Conference on the Widening of Resources of Coking Coals in the
Kuznetskiy Basin

with a total output of 51.1 million t/year should be in operation). Further developments in the Kuznetskiy Basin are in regions which contain mainly high ash and difficult-to-beneficiate coals. In the existing mines also some increase in the ash and moisture content is expected. Therefore, in new coal beneficiation plants, only wet treatment methods without preliminary separation into size fractions should be considered.

K.K. Kollodiy (Kuzbassugleobogashcheniye Trust) reported on methods of increasing the efficiency of coal beneficiation processes in existing coal beneficiation works in the Kuznetskiy Basin. Of 28 operating washeries, 21 are operating with the pneumatic method, 4 by a combination of pneumatic and wet process and 3 by wet method. During the last 5 years, the ash content of coals has increased by 2.1% and that of concentrates by 0.4%. In order to decrease the ash content in concentrates, secondary wet treatment of pneumatically cleaned coals was introduced on some plants. This decreased the ash content by 0.3% and increased the yield of concentrates by

Card6/8

SOV/68-59-1-16/26

Conference on the Widening of Resources of Coking Coals in the
Kuznetskiy Basin

1.5-2.5%. A cascade scheme of beneficiation was developed on pneumatically operating plants consisting of the fact that not individual-size fractions 6-10, 13-50 mm are treated in pneumatic separators USh-3 but 0-50 mm fraction. For jigging dust-containing coals 10-0 mm a synthetic bedding layer from heavy rubber was developed instead of felspar which was found to be very efficient.

A.A. Lukyanin (VUKhIN) in a paper "A Decrease in the Consumption of Coals K and K₁ on the Kuznetskiy Metallurgical Combine by Incorporating Into Blends Gas Coals" pointed out that coke ovens in the Urals and Siberia are designed for a standardised heating condition calculated for a coking period of 13-14 hours instead of 17 hours. Temperatures in the control flues 1 390 - 1 410°C. With increasing proportion of high-shrinkage coals, the quality of coke deteriorates. An increase in the coking period is impossible due to a shortage of coking capacity. Experimental work on coking indicated that it is possible to decrease the proportion of K coals but for this purpose, the existing technology of coal preparation and

Card7/8

SOV/68-59-1-16/26

Conference on the Widening of Resources of Coking Coals in the
Kuznetskiy Basin

coking conditions should be modified. For this purpose,
the development of an appropriate plant is necessary
(no details).

LINDENBERG, B.

✓ Methods of accelerating the hardening and increasing the strengths of concrete based on dolomite Roman cement: G. Kūninos and B. Lindenberg. *Latvijas PSR Zinātņu Akad. Vēstis* 1955, No. 8, 107-17 (in Russian; Latvian summary, 118).—To accelerate hardening of concrete compounded on the dolomite Roman cement (I) base under field conditions, steaming for 24-32 hrs. at 80-90° is recommended. In plant production, a scheduled 10-hr. treatment in an autoclave at 8 atm. was effective; substitution of 20-30% of I by sand or clay is recommended. Equations are given for calcn. of strengths of concretes based on mixed I and portland cements, both during air or underwater hardening. Addn. of CaCl₂ accelerator yielded inferior concrete. Repeated vibration during the first 7 days increased the strength of the above concretes by 43%. A. Dravnieks

LINDEMBERG, B.Ya.

Plasticity and strength of concrete on Sloka Roman
cement basis. B. Lindenberg and G. Kunnos. *Latvijas
PSR Zinātņu Zemgales iestādes*, No. 10, 19-100. Hardening
of concrete prep'd. from Sloka (Latvia) Roman cement
(from dolomites), with addn. of 8% CaSO₄, progressed pro-
portionally to logarithm of time, with a change in the consts.
of the hardening vs. time equation at the age of 28 days.
The hardness of concrete kept under water after prior aging
for 7 days in moist air was 0.8-0.9 of the air-hardened con-
cretes of the same type.
